1 Functional Overview

The Enlighted EM interface is a middleware application that enables communication between Enlighted Energy Manager API service with EcoStruxure Building Operation via EcoStruxure Web Services (EWS). The interface communicates with the Enlighted Energy Manager API to get the information about the Company, Campus, floors, and areas the user has access, and the fixtures present in the floors and stores it in the EcoStruxure Web Services (EWS).

The processor leverages the SmartConnector Service framework and details of the application (release history, installation notes etc.) are available separately and are not covered in this manual.

The SmartConnector application is licensed on a single server basis but may also be configured to connect to both Automation Server (AS-P) devices as well as Enterprise Servers (ES).

2 Restrictions & Limitations

2.1 SmartConnector Service Version

The processors have been configured to operate with the SmartConnector version 2.4.40, use with any other version of the SmartConnector framework is not supported.

2.2 EWS Supported Systems

The processors can support EcoStruxure systems operating with the EcoStruxure Web Services (EWS) protocol v1.1 and v1.2.

2.3 Enlighted EM Supported System

The SmartConnector has been tested and validated against the Enlighted Energy Manager API.

Other versions may cause issues and are not supported. Please check with your supplier.

3 Installation

Please refer to the SmartConnector Installation and Configuration Guide.pdf for guidance on SmartConnector installation.

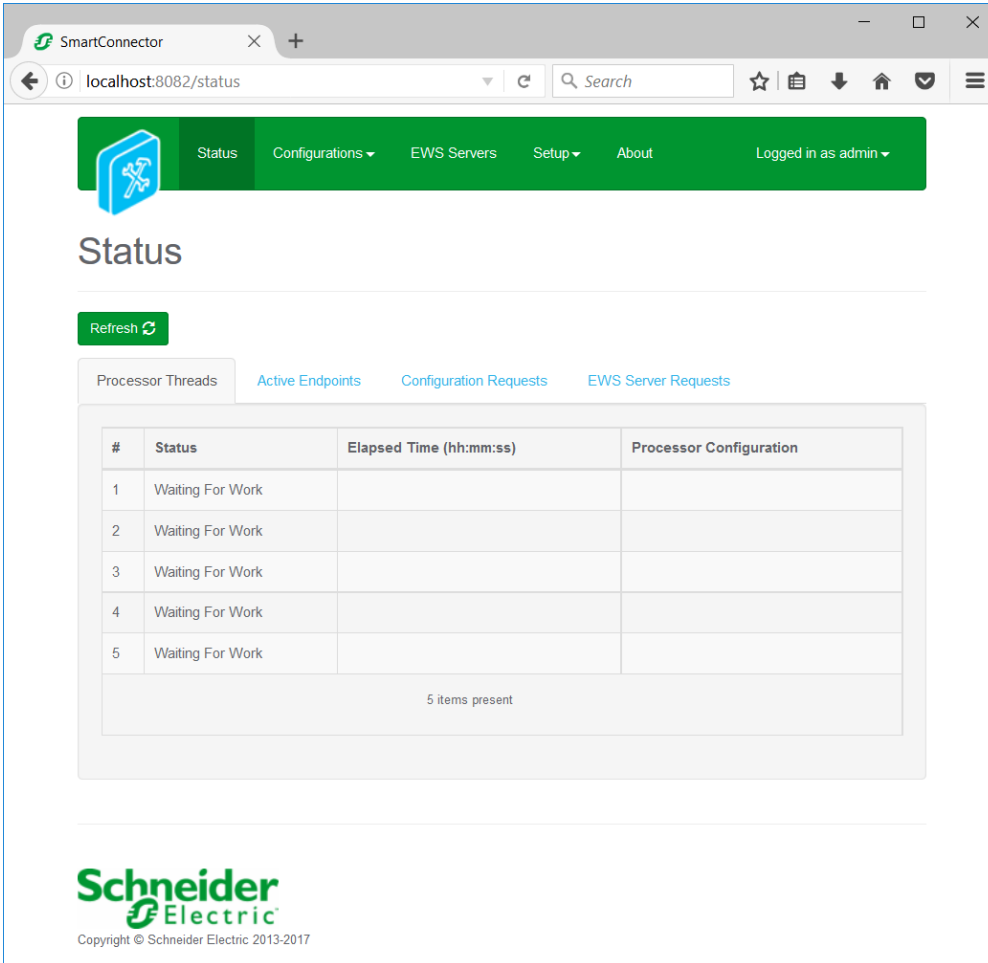

To deploy the Enlighted EM SmartConnector assembly, copy the files **“ISC.SmartConnector.EnlightedEMExtension.dll”**, **“SmartConnector.Utilities.dll”** and **“ISC.EnlightedEM.API.Wrapper.dll”** into the service installation directory. Normally **“C:\Program Files (x86)\Schneider Electric\SmartConnector”**

4 Configuration & Settings

4.1 Processor Configuration

With a default installation of SmartConnector, the configuration pages for the server can be reached at the following address on the server the service has been installed on:

<http://localhost:8082/>

The screenshot shows a web browser window with the URL `localhost:8082/status`. The page has a green navigation bar with a logo and menu items: Status, Configurations, EWS Servers, Setup, About, and Logged in as admin. Below the navigation bar is the "Status" section with a "Refresh" button. There are four tabs: "Processor Threads" (selected), "Active Endpoints", "Configuration Requests", and "EWS Server Requests". A table displays the status of five processor threads, all of which are "Waiting For Work".

#	Status	Elapsed Time (hh:mm:ss)	Processor Configuration
1	Waiting For Work		
2	Waiting For Work		
3	Waiting For Work		
4	Waiting For Work		
5	Waiting For Work

4.2 Adding the Custom Assembly to the Service

Switch to the Configurations tab and select Processor and click on Add New +

At the Add Configuration window, Step 1 – Pick an assembly, select the reference to “**ISC.SmartConnector.EnlightedEMExtension**” (this will be highlighted green when selected)

Add Processor Configuration

Step 1 - Pick an assembly

ISC.SmartConnector.EnlightedEMExtension	1 candidates
Mongoose.Process	3 candidates
SmartConnector.Utilities	1 candidates
SmartConnector.WeatherExtension	2 candidates

Assembly Description

ISC.SmartConnector.EnlightedEMExtension

Assembly Company

Schneider Electric Pvt. Ltd

Assembly Copyright

Copyright © 2022

Assembly Version

1.0.0.0

Select Next and proceed to Step 2 Choose a Class

Ensure the class “**ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmPeriodicProcessor**” is selected first

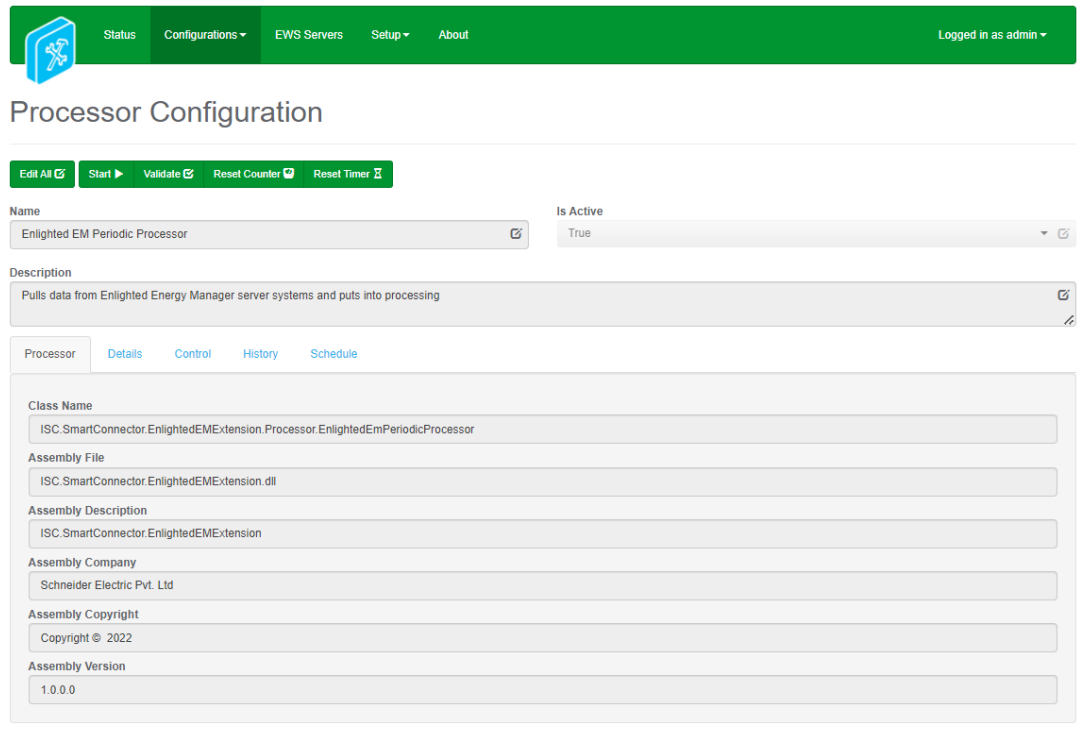

Step 2 - Choose a Class

ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmLongRunningProcessor
ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmPeriodicProcessor

Select Next and proceed to Step 3 Name Configuration

Enter a meaningful name and description for the Processor which will enable you to identify this process in the configuration window later.

Select Finish and proceed to the Configuration screen.

The screenshot shows the 'Processor Configuration' screen. At the top, there is a navigation bar with 'Status', 'Configurations', 'EWS Servers', 'Setup', and 'About'. The user is logged in as 'admin'. Below the navigation bar, the title 'Processor Configuration' is displayed. A toolbar contains buttons for 'Edit All', 'Start', 'Validate', 'Reset Counter', and 'Reset Timer'. The main configuration area includes fields for 'Name' (Enlighted EM Periodic Processor) and 'Is Active' (True). A 'Description' field contains the text: 'Pulls data from Enlighted Energy Manager server systems and puts into processing'. Below this, there are tabs for 'Processor', 'Details', 'Control', 'History', and 'Schedule'. The 'Details' tab is active, showing fields for 'Class Name', 'Assembly File', 'Assembly Description', 'Assembly Company', 'Assembly Copyright', and 'Assembly Version'.

In the configuration window select the Details Tab, you will then be presented with the screen to enter the configuration information. Much of the configuration has default options however they should be checked and validated for the installation. Edit the applicable fields as follows.

Base Url

The Base URL to connect to the Enlighted EM. By Default, it is https://<YOUR_TENANT>.emc.enlightedinc.com.

Username

Username needed to access the Enlighted EM.

Api Key

Api Key needed to access the Enlighted EM.

Proxy Address

Proxy Address that is used by the server/machine.

Proxy Port Number

Proxy Port Number that is used by the server/machine.

The screenshot shows a configuration window with a 'Details' tab. At the top, there are tabs for 'Processor', 'Details', 'Control', 'History', and 'Schedule'. Below these, there are buttons for 'Expand All' and 'Collapse All'. The 'Details' section contains several fields:

- Base Url *
- Username *
- Api Key * (displayed as ~ Encrypted ~)
- Proxy Address
- Proxy Port Number
- Enlighted Em Ews Server

Expand Enlighted EM Ews Server Configuration field

Ews Server Address

This property should be set to the full address required to access the EWS Server being hosted. This is normally in the case of a StruxureWare ES or AS device as follows:

[http://<IPADDRESS>:<PORT\(8093\)>/EcoStruxure/DataExchange](http://<IPADDRESS>:<PORT(8093)>/EcoStruxure/DataExchange)

***Note that the address is case sensitive!**

Ews Realm

Realm for the EWS Server.

Ews Server Name

This property is just a friendly text name field to allow you to easily identify the specific Endpoint you are configuring.

Ews Username

This property is required to allow the EWS server connection to be authenticated.

Ews Password

As above, this is the password related to the user credentials.

In the configuration window select the Control Tab, you will then be presented with several options to define the Processor's default behavior. It is recommended to set the following:

Runs On Start – Yes (To enable the Processor to automatically start with the machine)

Runs On Schedule – Yes (Define a schedule that determines how often the server is updated with messages received from the PMS)

Manually Startable – Yes (To allow a user to start through the configuration window)

Manually Stoppable - Yes

The Save Button allows the process configuration to be saved to the database.

A complete configuration will appear as follows:

Expand All Collapse All

Details

Base Url *

Username *

Api Key *
~ Encrypted ~

Proxy Address

Proxy Port Number

Enlighted Em Ewe Server

Ewe Server Address *

Ewe Realm

Ewe Server Name *

Ewe User Name *

Ewe Password *
~ Encrypted ~

After adding the first Processor, navigate back to Processor screen, click on 'Add New' and Select **"ISC.SmartConnector.EnlightedEMExtension"** (this will be highlighted green when selected)

Click on Next and select the processor **"ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmLongRunningProcessor"**. This is a long running processor, so we need to set the schedule interval.

Step 2 - Choose a Class

Click on Next and select Finish. Please provide the same configuration details and EWS server details, that has been provided to the processor - **"ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmPeriodicProcessor"**.

After Adding both the processors, first step is to run the periodic processor – **"ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmPeriodicProcessor"** only.

After this processor is executed once, we can execute the processor – **"ISC.SmartConnector.EnlightedEMExtension.Processor.EnlightedEmLongRunningProcessor"**, this is long running processor and will update the Area Occupancy state, Light Levels and Last communication time every 5 mins.

Once the Smart Connector EWS Server Interface has been hosted in EcoStruxure Building Operation, the sensor details grouped by area under floors will be displayed as follows:
